# TEST SUMMARY

## Objective

To conduct cone calorimeter testing and reduce the data in accordance with ISO 5660 (2002) as specified in New Zealand Building Code (NZBC) Acceptable Solutions Appendix C 7.1, on client supplied specimens for the purposes of determination of the Exterior Surface Finishes performance in accordance with

- NZBC Acceptable Solutions Section 5.8.1. a) and b)

## Test sponsor

Alucobond (Far East) Pte Ltd  
6 Shenton Way  
#40-05 OUE Downtown 1  
Singapore 068809

## Description of test specimen

The product as described by the client as **Alucobond A2**

## Date of tests

13 November 2018 and 8 February 2019

## Test results

For the purposes of compliance with the relevant building code documents, the following classification is considered applicable to the tested samples as described in Section 1.

Building Code Document		Performance
NZBC Acceptable Solutions Section 5.8.1	a)	Satisfied
	b)	Satisfied

# LIMITATION

The results reported here relate only to the item/s tested.

# TERMS AND CONDITIONS

This report is issued in accordance with the Terms and Conditions as detailed and agreed in the BRANZ Services Agreement for this work.

# 1. GENERAL

The product submitted by the client for testing was identified by the client as **Alucobond A2**, a nominally 4.0mm thick, composite panel comprising two layers EN-AW5005 grade 0.5mm thick aluminium layers covering a 3.0mm mineral filled core with less than 10% combustible binder content. The front facing metallic silver painted aluminium skin was removed prior to testing. Figure 1 illustrates representative specimens of that tested.

**Figure 1: Representative specimens (front face left, back face centre, core right)**

## 1.1 Sample measurements

The following physical parameters were measured for each specimen prior to testing.

**Table 1: Physical parameters**

Specimen ID	Initial properties		Overall apparent density (kg/m <sup>3</sup> )	Colour
	Mass (g)	Mean thickness (mm)		
FH10913-2-50-1	68.9	3.3	2088	Silver
FH10913-2-50-2	71.0	3.3	2152	Silver
FH10913-2-50-3	73.3	3.3	2221	Silver
FH10913-2-50-4	67.6	3.2	2113	Silver
FH10913-2-50-5	67.9	3.2	2122	Silver
FH10913-2-50-6	68.9	3.2	2153	Silver

Note: All measurements exclude front facing aluminium skin

## 2. EXPERIMENTAL PROCEDURE

### 2.1 Test standard

The tests were carried out and data reduced according to the test procedures described in ISO 5660: (2002), Reaction-to-fire tests – Heat release, smoke production and mass loss – Part 1: Heat release rate, and Part 2: Smoke production rate. The sample preparation and test procedure are as described in 2.4 and 2.5.

### 2.2 Test date

The tests were conducted on the 13 November 2018 and 8 February 2019 by Mr James Quilter and Mr Lukas Hersche at BRANZ Limited laboratories, Judgeford, New Zealand.

### 2.3 Specimen conditioning

All specimens were conditioned to moisture equilibrium (constant weight), at a temperature of  $23 \pm 2^\circ\text{C}$  and a relative humidity of  $50 \pm 5\%$  immediately prior to testing.

### 2.4 Special weathering

According to Acceptable Solutions Appendix C 7.1.3, timber claddings which have a fire-retardant treatment incorporated in or applied to them are required to be subjected to the regime of accelerated weathering described in ASTM D 2898 Method B with the water flow rate from Method A before testing. The tested specimens were not timber claddings and therefore were not subjected to the accelerated weathering.

### 2.5 Specimen wrapping and preparation

All tests were conducted, and the specimens prepared in accordance with the test standard. The spark igniter and the stainless-steel retainer frame were used during testing. All specimens were wrapped in a single layer of aluminium foil, covering the unexposed surfaces. Prior to testing all samples had the front facing aluminium skin removed.

### 2.6 Test programme

The test programme consisted of six replicate specimens as identified in the Table 1, tested at an irradiance level of  $50 \text{ kW/m}^2$ . All tests were carried out with the specimen horizontal, and with a nominal duct flow rate of  $0.024 \text{ m}^3/\text{s}$ .

### 2.7 Specimen selection

BRANZ was not involved in the selection of the materials submitted for testing. The test materials used were supplied to the laboratory by the client.

	REPORT NUMBER: <b>FH10913-1</b>	ISSUE DATE: <b>4 April 2019</b>	REVIEW/EXPIRY DATE <b>4 April 2024</b>	PAGE: <b>6 of 11</b>

## 4. SUMMARY

The test standard requires that the mean heat release rate (HRR) readings over the first 180 s from ignition for the three specimens should differ by no more than 10% of the arithmetic mean of the three readings. In the event of this criterion not being met, a further three specimens are required to be tested.

**Table 3: Heat release rate**

Specimen ID	Average HRR over 180 s from ignition	Arithmetic mean	% difference from the arithmetic mean
FH10913-2-50-1	40.7	54.8	-25.7%
FH10913-2-50-2	63.5		16.0%
FH10913-2-50-3	60.1		9.8%

Table 3 identifies two specimens exposed to 50 kW/m<sup>2</sup> irradiance exceeded the acceptance criteria. A further set of three tests, as required by the test standard were undertaken and results are provided in Table 4 below.

**Table 4: Heat release rate**

Specimen ID	Average HRR over 180 s from ignition	Arithmetic mean	% difference from the arithmetic mean
FH10913-2-50-1	40.7	52.7	-22.9
FH10913-2-50-2	63.5		20.5
FH10913-2-50-3	60.1		14.1
FH10913-2-50-4	41.8		-20.7
FH10913-2-50-5	58.7		11.3
FH10913-2-50-6	51.5		-2.3

**Table 5: Report summary for six replicate specimens**

Mean Specimen thickness (mm)	Irradiance (kW/m <sup>2</sup> )	Mean Time to Ignition (s)	Mean Peak Heat Release Rate (kW/m <sup>2</sup> )	Mean Total Heat Released (MJ/ m <sup>2</sup> )
3.3	50	214	75.4	15.6

## 5. RESULTS FOR NZBC ACCEPTABLE SOLUTIONS SECTION 5.8.1

In accordance with NZBC Acceptable Solutions Section 5.8.1 a) and b) for external walls the mean test results must not exceed the Peak Heat Release rate and Total Heat Release shown in Table 5.

**Table 6: NZBC Acceptable Solutions Section 5.8.1 a) and b) requirements**

	NZBC Acceptable Solutions Section 5.8.1 Requirement – values shall not exceed	
	(a)	(b)
Peak Heat Release rate (kW/m <sup>2</sup> )	100	150
Total Heat Release (MJ/m <sup>2</sup> )	25	50

The samples as described in Section 1 had the following results when reduced over the 15-minute (900 s) period as specified in Appendix C 7.1.2 as shown in Table 6.

**Table 7: NZBC Acceptable Solutions Section 5.8.1 a) and b) requirements**

	Sample 1	Sample 2	Sample 3	Performance
Peak Heat Release rate (kW/m <sup>2</sup> )	73.6	88.0	78.3	Meets a) and b)
Total Heat Release (MJ/m <sup>2</sup> )	15.8	17.9	17.4	Meets a) and b)
	Sample 4	Sample 5	Sample 6	Performance
Peak Heat Release rate (kW/m <sup>2</sup> )	66.9	79.9	65.3	Meets a) and b)
Total Heat Release (MJ/m <sup>2</sup> )	14.1	13.9	14.2	Meets a) and b)

The tested samples recorded a mean Peak Heat Release of 75.3 KW/m<sup>2</sup> and a mean Total Heat Release of 15.6 MJ/m<sup>2</sup> and it is therefore considered to satisfy the requirements of NZBC Acceptable Solutions Section 5.8.1 a) and b).

## 6. NZBC CONCLUSION

For the purposes of compliance with the relevant building code documents, the following classification is considered applicable to the tested sample as described in Section 1.

Building Code Document	Performance
